

Main Rubric for Determining Relevance to Environmental Conservation

An article/event is classified as relevant to conservation if it involves the protection, preservation, restoration, or sustainable management of natural environments, species, and ecosystems. This includes activities related to infrastructure that impact the environment or wildlife.

The relevance can be identified through discussions on:

1. **Wildlife Protection:** Efforts to protect endangered species, reduce human-wildlife conflicts, and preserve natural habitats. Keywords like "human-wildlife conflict", "animal attack", "wildlife encroachment", "wildlife conservation conflict", "illegal wildlife trade", "poaching", "wildlife trafficking", and "endangered species trade" point to conservation issues involving the protection of animals and their habitats from illegal activities or human encroachment. Human-wildlife conflict (HWC) occurs when humans and wild animals interact in an unsafe or unwanted way, leading to negative consequences for both people and wildlife. HWC can include the loss of property, livelihoods, and even life. Illegal wildlife trafficking is one of the most profitable natural resource crimes. It encompasses the harvesting and selling of wildlife, and wildlife products, (including pelts, ivory, plants, and furs) to be used as medicine, fashion, food, or pets sold to consumers.
2. **Habitat Conservation:** Activities focused on preserving terrestrial, freshwater, or marine habitats. For instance, "conservation infrastructure" and "water projects ecology" relate to efforts aimed at maintaining the integrity of specific habitats and ecosystems.
3. **Biodiversity:** Initiatives aimed at protecting plant and animal diversity. Terms such as "species loss" or "biodiversity" signal discussions on the variety of life forms in an area and the importance of their preservation.
4. **Environmental Restoration:** Projects or policies aimed at restoring damaged ecosystems, such as reforestation, wetland restoration, or rehabilitating polluted areas. Articles mentioning "restoration" or "invasive species" often pertain to efforts to repair ecological balance.
5. **Sustainable Resource Management:** Topics covering sustainable practices in forestry, fishing, and agriculture. Keywords like "sustainable," "natural resource management," or "ecosystem services" indicate conservation efforts to manage resources responsibly.
6. **Infrastructure Impact:** Conservation also encompasses the environmental aspects of infrastructure development. This includes the planning, construction, maintenance, or impact of physical structures and systems, particularly in how they affect natural environments and wildlife. Specific areas include:
 - **Transportation Systems:** Roads, highways, bridges, railways, airports, and transport corridors. For example, articles mentioning "road construction wildlife," "transport corridors migration," or "energy lines birds" indicate infrastructural development that impacts wildlife migration patterns or habitats.
 - **Urban Development:** Urban expansion, housing projects, and city planning. Terms like "urban expansion habitat" or "deforestation development" highlight instances where urbanization affects natural habitats or leads to deforestation.
 - **Resource Extraction:** Mining operations, oil and gas exploration, and related activities. Keywords such as "mining ecosystems," "oil gas conservation," or "extractives" pertain to how the extraction of natural resources impacts the environment.

- **Energy Infrastructure:** The establishment of dams, power plants (including renewable energy sources), and electrical grids. Examples include "dam rivers" and "renewable energy biodiversity," indicating how energy projects can alter river ecosystems or impact biodiversity.
- **Industrial and Agricultural Infrastructure:** Factories, industrial zones, and large-scale agricultural developments. Keywords like "industrial pollution" and "agricultural expansion species" suggest infrastructure impacting the environment through pollution or habitat alteration.

Instructions for Human Evaluators for Article Relevance Pipeline

The goal of this evaluation is to assess the precision and relevance of the classifications, tags, and summaries generated by GPT-4 based on the provided article content. You will verify whether the AI-generated outputs are appropriate and accurately reflect the content of the articles. The focus is on validating positive instances (precision) provided by the AI. For each component, provide a binary response indicating whether you think the AI outputs are relevant and accurate.

Key Components to Evaluate

1. **Relevance to Conservation**
 - **Instruction:** Assess whether the article content pertains to conservation topics based on the predefined rubric. If the AI marked the article as relevant to conservation, determine if this classification is appropriate.
 - **Binary Response:** Yes/No
2. **Subcategories (if relevant to Conservation)**
 - **Relevance to Human-Wildlife Conflict:** Does the AI accurately identify this as a topic in the article?
 - **Binary Response:** Yes/No
 - **Relevance to Illegal Wildlife Trade:** Does the AI correctly label the article as discussing illegal wildlife trade?
 - **Binary Response:** Yes/No
 - **Relevance to Infrastructure Impact:** Is the infrastructure impact correctly identified by the AI?
 - **Binary Response:** Yes/No
3. **Location**
 - **Instruction:** Determine if the geographical context provided by the AI is accurate and specific (city, region, or country).
 - **Binary Response:** Yes/No
4. **Flora and Fauna**
 - **Instruction:** Verify whether the AI correctly identifies specific species or plant life mentioned or implied to be impacted.
 - **Binary Response:** Yes/No
5. **Categories**
 - **Instruction:** Check if the AI's selected categories accurately describe the article content (e.g., "Wildlife," "Forests").

- **Binary Response:** Yes/No
6. **Tags**
 - **Instruction:** Determine if the tags generated by the AI are relevant to the key topics in the article (e.g., "Pollution," "Illegal Wildlife Trade").
 - **Binary Response:** Yes/No
 7. **Summary**
 - **Instruction:** Evaluate whether the AI's summary accurately captures the main points of the article in three lines or less.
 - **Binary Response:** Yes/No
 8. **Named Entities**
 - **Instruction:** Confirm that the AI accurately identifies significant individuals, organizations, or locations mentioned in the article.
 - **Binary Response:** Yes/No

Evaluation Process

Preliminary Steps

1. **Read the Full Article:** Carefully review the entire article to understand the context, key points, and relevant information.
2. **Review the AI Output:** Examine the outputs generated by GPT-4, including relevance to conservation, location, flora and fauna, categories, tags, summary, and named entities.

Detailed Assessment

For each component listed above, provide a binary response (Yes/No) indicating whether the AI's output is appropriate and relevant to the article. Focus on verifying the correctness and relevance of the AI's outputs rather than generating your own set of tags or classifications. This process optimizes for precision, ensuring that the AI's positive classifications are accurate.

Instructions for Human Evaluators for Event Pipeline

Objective: The primary objective of this evaluation is to assess the accuracy and quality of the event summaries and detailed descriptions generated by the system. You will validate whether the extracted and summarized information aligns with the content of the original articles and whether the provided JSON structure is correctly formatted and comprehensive. Report your findings with a binary "Yes" (accurate and relevant) or "No" (inaccurate or irrelevant).

Evaluation Criteria

A. Relevance and Accuracy

1. Event Title and Category

- **Instruction:** Verify that the event title accurately represents the main focus of the event. Confirm that the category is correctly identified as "Human-Wildlife Conflict," "Illegal Wildlife Trade," or "Infrastructure Impact".
- **Reporting:** Indicate "Yes" if the title and category are accurate and relevant, "No" if they are not.

2. Event Summary

- **Instruction:** Review the event summary for clarity and accuracy, ensuring it provides a concise overview of the event without missing significant details.
- **Reporting:** Indicate "Yes" if the summary is factually correct and comprehensive, "No" if it lacks accuracy or omits key points.

3. Event Actions

- **Instruction:** Assess whether the suggested actions are relevant and practical, appropriate for the described event.
- **Reporting:** Indicate "Yes" if the actions are specific, actionable, and relevant, "No" if they are not.

B. Completeness and Detail

1. Details Section

- **Instruction:** Check if the "details" section includes all unique information from the source articles, such as specific incidents, responses, and additional context.
- **Reporting:** Indicate "Yes" if the details are thorough and accurately reflect the source content, "No" if they are incomplete or inaccurate.

2. Source Attribution

- **Instruction:** Confirm that each piece of unique information is correctly attributed to its source URL.
- **Reporting:** Indicate "Yes" if the information is properly attributed and not misrepresented, "No" if attribution is incorrect or missing
